

As the flagship of the APTUS lineup, Fasilitor is extremely concentrated, pure and fast acting. Silicon is a crucial and highly essential element needed for the optimisation of plant growth, and monomeric silicic acid, as found in Fasilitor, is the only 100% bio-available form of silicon which is available for immediate absorption by plants.

builds stronger cell structures to support heavier fruit

creates thicker cell walls to resist attack from pests and pathogens

increases resistance against salinity

reduces transpiration

shortens internodal spacing

increases nutrient uptake

maximises dry yields

increases vascular pressure

improves quality

densifies plant tissue

stimulates nitrogenase activity

heightens mineral translocation

Unlike other silica products on the market that contain potassium or calcium silicates which take weeks or months to become available, the patented and stabilised concentration of monomeric (single molecule) silicic acid particles in Fasilitor are absorbed into your plant within minutes!

HOW MUCH TIME DO YOUR PLANTS HAVE?
